Adobe Photoshop features This tutorial lists some of the most useful features of Photoshop, and explains how to access them. Adjustment layers Adjustment layers let you apply adjustments to the image over a particular area of the layer to manipulate exposure, contrast, color, and more without affecting the entire image. The Adjustment Layers dialog box lets you selectively add, subtract, and move layers. You can drag selection handles to move layers, and you can click and drag a layer thumbnail to add or subtract a copy. The Layers panel, shown here, is used to manage the layers in a document. There are basic add/subtract commands to add layers, and the Add Layer Mask command. You can also shift-click (Mac) or click-drag (PC) thumbnail images on the Layers panel to duplicate or move the layers, and click the new image to add it as a new layer. You can choose to lock a layer or not to lock a layer so you can still move it if you change the order or shift it around in the Layers panel. Layers panel Once you add an adjustment layer to a Photoshop document, you can apply the adjustment to a selection by selecting the Layer Mask icon. Layer masks control how the adjustment appears in the layer, and also control the visibility of the layer. The Layer Mask icon is shown in the layer panel with the text you specify next to it and is visible when you have a selection active. You can drag the mask to stretch it, shrink it, or adjust its position in the layer. The layer's color and position can be adjusted through the Layers panel, and the position of the layer can be locked. Locking a layer prevents you from moving it. You can trim a layer from the image by using the Layer → Trim command (the Pencil icon), or you can cut it out of the image entirely with Layer → Erase. Layer panel Image profiles

Using an image profile, you can convert an image to a different color profile format that best matches your particular device. The color gamut of a device can have a bigger range than what can be represented by a device's monitor or camera. This means that if your image is edited, it may not look the same after being saved as it did when you created it. An image profile converts the colors and tones

Teenagers have to make a lot of choices: who they want to hang out with, what they want to do, and who they want to date. Do you call your dad or your mom when you make a mistake? What if you get so busy with all of your responsibilities that you make mistakes? Life can get really busy. One of the greatest decisions that we are responsible for is the decision to become involved with God. When you make a decision about where God fits into your life, you will have more choice in the direction of your life. Even after your decisions, you still will have a choice: will you use the choices God has given you, or will you use your own un-Godly judgment? God would not have given you a choice if He wanted you to use your un-Godly judgment. What is a Radiologist-directed Ultrasound Service? By Christina Antipow on March 25 2017 in Radiology An ultrasound technician and an experienced radiologist are on-hand to provide ultrasound-guided procedures for clinicians. Ultrasound-guided procedures are a collaborative effort between an experienced radiologist and a technician to provide a safe, accurate and effective clinical service. Ultrasound-guided procedures allow diagnostic and therapeutic procedures that are performed at the site of a lesion or tissue abnormality. These procedures help guide the clinician to help with an accurate and precision diagnosis for a lesion or a needle biopsy. An ultrasound technician guides the clinician through the procedure while the radiologist visualizes the procedure on the ultrasound screen. The Role of the Ultrasound Technician An ultrasound technician undergoes a rigorous training process to obtain certification to perform ultrasound-guided procedures. They also gain experience through working with different imaging systems and working with radiologists on ultrasound-guided procedures. Rideau Lakes Rideau Lakes are natural dams located in the Rideau Valley. They are on the Rideau Canal in what is now Kingston, Ontario, Canada. The lakes were formed in the mid-1800s when the government built the Rideau Canal. Before this time, Rideau River, as it was called, was a series of streams. The headwaters of the Rideau River are just north of the Rideau Lakes. More than five million visitors a year come to the Rideau Lakes via the canal and its eight bridges, viewing the dozens of houses built along the canal on the western bank of the canal. At Rideau Canal Heritage Sites, signs illustrate the interesting history of the canal and the Rideau Lakes. I can't SSH into my new server from my Mac, or a windows box. I've tried to SSH into the server using the IP. When I open the firewall and firewall logs for the time period I was trying to SSH into the server I see entries for 2 minutes. If I tried for the entire 2 hours it would only log 2 entries. I've made the obvious changes to iptables and sshd_config. I've compared sshd.conf on the server with one I was SSHing into successfully from my mac and they are identical. Any ideas what else to try? For those who are unfamiliar with the box, it's a fresh install of CentOS 6.2 with OpenSSH 7.2. The box is behind a hardware firewall and DHCP works fine. You'll need to configure iptables to allow your target machine to communicate with the outside world.
