Chitosan nanoparticles as a carrier for salmon-derived bioactive peptides. Chitosan nanoparticles were prepared from chitosan hydrochloride using a modified double emulsion method. The average diameters of chitosan nanoparticles were measured by dynamic light scattering (DLS) and Transmission Electron Microscopy (TEM). The morphological properties and the size of the nanoparticles were determined by TEM. The encapsulation efficiency (EE%) and loading capacity (LC%) of the bioactive peptides were determined in aqueous solution. Results indicated that encapsulation efficiency of the salmon peptide within chitosan nanoparticles was higher than that without chitosan. The LC% of the salmon peptide in the chitosan nanoparticles was 2.8%, which was similar to that of free salmon peptide solution. Salmon peptides are regarded as antioxidant, anti-tumor, anti-inflammatory, anti-aging, and anti-hypertensive. The chitosan nanoparticles prepared in this study could be used as a new carrier of salmon peptide, which might be a possible alternative to the solution administration of salmon peptide.

Hemiplegia and dysarthria. Hemiplegia and dysarthria are closely associated symptoms that frequently occur in the elderly. Although many causative disorders are rare and sporadic, other causes include the development of ischemic infarcts with or without carotid or vertebral artery occlusion. Although traditionally believed to be irreversible, much information on recovery has become available in recent years that helps to guide treatment decisions. New treatments, including venous thromboembolism prophylaxis and antithrombotic agents, improve recovery and

may also improve mortality. Prognosis for recovery is difficult to predict.Q: Logging to external logger in spring without using explicit bean? I want to log to two 3da54e8ca3
