The numerical simulation of the ion transport is a challenging task. The input data for numerical simulations include the particle density distribution, the profiles of the magnetic field, electric potential, and temperature. These profiles are obtained through the solution of the Boltzmann equation using the collision operator, which generally depends on the particle density distribution, the magnetic field, the electric potential, and the temperature. The space–time–energy analysis is performed to understand the transport processes. The following aspects of ion transport dynamics are very important in addressing fundamental questions related to the fusion plasma : • How a particle move under the action of the Lorentz force? What is the displacement or the stopping effect? How many times a particle is trapped in a local potential well and collision probability? How does the dynamic transition happen in the competition of these effects? • How the particle transport is affected by the electron temperature and the magnetic field? How are the ion temperature, the ion density, and the temperature gradient related to the transport of ions? • What are the factors affecting the transport of ions in fusion reactors? How is the transport of ions in the plasma affecting the confinement of electrons and the confinement of the ions? • What are the fundamental issues that affect the design and optimization of the plasma? The program will analyse your text and show what word are most common in that particular document. So lets say in a Microsoft Word Document you have 5000 words, in Word List you will see the Top 500 Words which will be displayed in descending order. Word List is a small application to find frequent word in a text file. The application is small in size and fast in performance. Word list can be run in batch mode by selecting desired text file and clicking on the "Start" button. This would be very handy in case of large amount of text files. Limitation: The frequency of word list is based on certain text file, as it is not possible to cover the whole word list with one hotkey. For example if you type "exit" then each word list will be initialized, if you type "yes" all words will be linked to each other, If you type "exit" again all words will be separated and you have to start a new word list with "yes".
