What's New In AutoCAD?

As a user of AutoCAD, you may have received feedback from your colleagues and customers, as well as applications like Intergraph Feedback Assistant and other sources. You can import this feedback directly into your designs to be acted upon in the next drawing. In 2019, it took a lot of work to incorporate this feedback and convert it to a change in the next drawing. Now, in AutoCAD 2023, import and incorporate feedback are made easy. The Markup Import wizard enables you to import graphics into your drawing based on the AutoCAD format for this purpose. Markup Assist simplifies this process by taking out the human effort required to check for changes and update the drawings. Changes can be imported into drawings based on the categories in an original drawing or into a newly created drawing. For more information, see the following video. Rasterizing Large Scale Printouts in a Drawing: AutoCAD 2023 uses the latest version of the PrintGrid technology to rasterize large, continuous printouts from AutoCAD applications. PrintGrid lets you rasterize and position the exact edges of printouts, and it is a good choice for CAD work, where you need to use reference printouts for your designs. In previous versions, the PrintGrid technology could handle only one or a few large printouts at a time. Now, the PrintGrid technology has been improved to handle large, continuous printouts and continuous routes. In a large printout, the paper feeder records the start and end points of the printout. In a continuous route, the paper feeder records the starting and ending points of the continuous route. As you move the feeder along the printout, the PrintGrid is able to rasterize the printout. In the PrintGrid settings, you can: Rasterize the printout for a specific layer: Rasterize the printout only for the layer to which you have assigned the print option in the PrintGrid options. Rasterize the printout in the entire drawing: Rasterize the printout in the entire drawing. Rasterize only the outside layer of the printout: Rasterize the printout in only the outermost layer of the printout. Rasterize the printout in the entire drawing, and skip to the next printout in the continuous feeder route: Rasterize the printout in the
