Sikuli IDE enables you to automate any desktop application with Python, by means of taking screenshots and inserting them into a script. The application is not difficult to use, but the explicit documentation is there to help you in case you get stuck along the way. Its interface is simple, comprising accessible and clear options, which makes it very intuitive. A rich set of commands The command list is available in the left pane, containing all the functions that you can insert into the script, which will have a captured image as the argument. You can find a certain element on screen, wait for a GUI component to appear on the screen or disappear, perform simple, double or right clicks, gain focus on the target window and then type or paste a text. Use screenshots or images as function arguments You start by taking screenshots of the target elements, so that Sikuli IDE can visually identify the elements to click on, drag and drop or hover the mouse cursor over. Alternatively, Sikuli IDE also enables you to insert locally stored images into the script and define screen regions. The capturing mode can be activated using the dedicated button in the toolbar or the designated hot key. It freezes the screen and enables you to draw a rectangle around the desired area, inserting a small thumbnail in the script. The code can be saved to file or to a HTML document, but not before you test it to see if it runs properly. You can launch the script and watch how it takes control over your mouse cursor and executes all the actions, in the defined order. ## Sikuli IDE Activation Key Free

Sikuli IDE uses the Sikuli library for recognizing certain GUI elements on the screen. Sikuli is a powerful tool that allows you to programmatically control a computer program (such as Java, Perl, C#, Visual Basic, etc.) using an image of a screen element. The goal is to allow the user to recognize on-screen elements using Sikuli, without the need to learn how to use Visual Basic, C#, Java or other programming languages. Here's how it works:

- \* Programmatically control the mouse pointer on the screen to click on a pre-defined element.
- \* Programmatically control the mouse scrollwheel.
- \* Programmatically control window position, size, and menus.
- \* Programmatically scroll the screen vertically and horizontally.
- \* Programmatically drag and drop an image into another window. Using Sikuli allows the automation of any interaction. By definition, a script automates repetitive tasks using this tool. It is the easiest way to automate actions in applications or desktop environments, and can be used to automate virtually any application.
