What's New in the?

Radar Website Monitor is a website monitoring utility. This software is designed to monitor your website and inform you of any performance concerns (websites that are slow to

---

load, become inaccessible, load incorrectly or unnecessarily) by a variety of different methods. You can set up the time interval between alerts and you can choose what sort of events will trigger an alert. Key Features - Automatic checks: With every start-up this program checks your site and detects if it fails to load, is slow to respond or simply is not accessible. You can view, modify, or log these test results yourself. - Page overview: You can view detailed reports showing the status of every page in your site. You can choose to view the page status reports for your site as you go through it, or just select any section of the page and view a detailed page status report for just that page or section. - Goto page: If your site is slow to load, inaccessible, or

---

simply does not load and you want to know more about what is causing the problem, you can use this feature to make your own page-by-page navigation through your site to find out the exact page that is causing the problem. - Automatic User Search: Your site may ask visitors for credentials or a login/pass, your site can cause problems simply because it is asking for the wrong things or because the visitors are being slow to enter these credentials. You may want to display a message to the visitors to encourage them to enter credentials to finish the transaction. - Change Detection: Your site may change without you noticing. Because of this you may want to check for changes on your site frequently (like once a day) to ensure you are not going to cause

---

problems for your visitors. Radar Website Monitor detects any changes and alerts you when they happen. - Return Page: With radar website monitor you can choose to have the program send a request for each page on your site so you can determine if the page is slow to load or simply unavailable. - Scripting: You can use any scripting language to detect the status of your site, The program will read the file names of all the files on your server and determine if they exist, if they are larger than a given size or if they have been modified within a given date range. - Email Notifications: You can define what kind of event will trigger an email report. - Email Options: You can define the frequency of email alerts and you can even set a message that

---

will be sent
