
[VERIFIED] Crack Octopus Box Lg

The even more and generally used updated gadget for Samsung mobile phone cell phones and

Q: What is the difference between the backslashes, forward slashes and forward slashes in this example? I have seen that in some examples, the code was like this :

`@(string.Format("{0}/{1}", CustomerID, CustomerName));` And in some, it is written like this :
`@(string.Format("{0}/{1}", "{0}", "{1}"));` Can anyone help me understanding the difference between them? A: The first one is used to generate a url, and the second is used to generate

a string literal within the local context. In the first example, the `string.Format` method is invoked on the `CustomerID` and `CustomerName` parameters, and a string is returned whose body is the result of formatting those parameters. In the second example, the `string.Format` method is invoked on the first string parameter, and the resulting formatted string is returned as the body of the method invocation. The example uses two curly braces to specify a string literal (e.g. `CustomerName`), and a backslash to escape the slash character. There are two problems with the way that method is used in the first example: The `{0}` and `{1}`

placeholders are not used. They are simply values supplied to the `string.Format` method. If you wanted to actually use that method to insert `CustomerID` into `CustomerName`, you would use it like this: `string url = string.Format("/{0}/{1}", CustomerID, CustomerName);` /** *
