Surgical intervention, or "out-patient" surgery, comprises a wide variety of nonsurgical procedures as well as procedures such as cataract extraction and glaucoma surgery, which can be performed on an out-patient basis or in an in-patient facility. The standard for out-patient surgery is to schedule the surgery for the smallest number of hours that will provide the best combination of safety, comfort, and outcome. Out-patient surgery is characterized by a shorter length of stay in the hospital, a lower hospital cost, and more rapid return to a normal life and work setting. Also, patients may be at their own place of residence when the surgery is performed. In addition, home health care providers may be employed to manage the patient's postoperative care and recovery. Out-patient surgery can be safely performed in the outpatient setting with a number of different medications including topical corticosteroids, corticosteroid medications intracamerally or bilaterally, epinephrine, neurotoxins, cycloplegics, and anesthetics.

Ion channels are pore-forming assemblies that interconnect the internal and the external environment. Characterization of ion channels and their contribution to biomembranes and signaling is one of the key challenges in modern cell biology and molecular biology. The use of direct electron microscopy of membrane proteins has provided insights into the structural properties of ion channels, and has facilitated the characterization of their assemblies in membrane bilayers. We describe here a methodology to characterize ion channels in bilayers and to study their assembly. Using non-cryogenic single-particle electron microscopy, we have identified and visualized single-channel properties in membrane bilayers.More Information New York City, New York (IATA) | ALIA Miami-Dade (LAT) | 1-800-ALIA | miamiar.org Online booking is not currently available.
