Huawei E357;; Huawei E361;; Huawei E5170;; Huawei E5220;; Huawei E5221;. a DC-Unlocker/Rocker/Vygis or "eternal" dongle (USB Key, used to unlockÅ .Q: awk equivalent of test and IF in R I have a huge data frame - with multiple columns - that I would like to apply two operations on: (1) Column A = 'Y' or 'N' (2) Column B = SUM of column A AND column B My initial thought was to convert to a data frame and then do an apply function (as I'd like to apply on the whole data frame), but converting using stack function doesn't seem to apply the same logic, but does convert to a matrix. Here's the "original" code in R d=read.table("data/test.txt",header=FALSE,sep="\t",stringsAsFactors = FALSE) d\$v1=c(1:6) d\$v2=c("Y","N","Y","Y","N") d2=data.frame(d) names(d2)=c("v1","v2") sum(d2\$v1) Which I need to make equivalent in BASH and AWK (since R has problems with large dataframes). I tried this d0c515b9f4

. Chinese LanguageBook. A free summary of the book, to download in pdf or read online for free. By Zhao Weiping english francais russe français chinois.Q: PHP Object: how can i move all strings to one variable? I have this object: Class stdClass Object ( [id] => 4 [list] => Array ( [0] => d [1] => e ) [data] => Array ( [0] => Array ( [id] => 4 [name] => Name 4 ) [1] => Array ( [id] => 5 [name] => name 5 ) ) ) this is what i know how to get the data... while(\$row = \$stmt -> fetch()) { \$arr = \$row['list']; \$arr = json\_decode(json\_encode(\$arr)); \$data[] = \$arr; } or this: while(\$row = \$stmt -> fetch()) { \$arr = \$row['list']; \$data[] = array\_map('json\_decode', \$arr); } But i'm not sure what's best. I want to get [id] => 4 and [id] => 5 [name] => Name 4 [name] => name 5 is it better to use foreach? Foreach would be good but in a new variable i have to access the name in this case This is what i want to do: \$myObject = new stdClass(); \$myObject->id = \$row['id']; \$myObject->list[0] = \$row['list']; foreach(\$myObject->list as \$key => \$item) { foreach(\$item['data'] as \$key2 => \$item2) { \$myObject->data[\$key2][\$key]['name'] = \$item2['name']; } } var\_dump(\$myObject); A: I would use the returned array of a prepared statement as the key for your data object. // use a prepared statement to prevent injection attacks and set the correct input parameters \$stmt = \$dbh->
