Launch Autocad, go to preferences and select "Autocad Account", where you find the key and do what is written there. IMPORTANT NOTE: The keygen will work with any version of Autocad from the beginning to the most recent one. The version you have installed has no effect on the activation key. If you activate the key with a wrong version, you will lose the activation. If you still have the activation key for an old version of Autocad, we advise you to write it down before installing Autocad 2018 and using the keygen. X Thanks to Justin L for this tip! I'm working on a web app that lets you paint an image on a background image. I have a canvas that's used to paint on a separate canvas. This looks great but has some drawbacks. I have to make sure the canvas coordinates match the background image coordinates when moving it. That means I have to make sure I have a translate to move the canvas along x and y to match the background image. I'm not used to working with canvas so using other UI elements like buttons and labels are much easier for me. I'm just wondering if there is a good reason for this setup or if there is a better solution. A: The best is a combination of the two. Some application you should decide for a single canvas and just draw on the canvas depending on some conditions. For example, if you have a mouse cursor you draw the mouse cursor on a canvas. If there's no mouse cursor then you simply draw a semi-transparent black border around the canvas. The canvas does not know anything about the background image. Of course this is a simplified example, in your app you should try to avoid the burden of having to transform the canvas' coordinate system in order to
