How do I download PS3 firmware without any internet connection?Q: Detecting and avoiding register allocation redundancies There is a phenomenon I would like to detect, and also understand better. I know, I can use graph coloring to detect runtime redundancies in my program. But that is not the same thing. The more general case is this. We have a set of objects, with a set of fields. We know that during some method invocation, a certain field is accessed by multiple objects. Thus I can trivially detect runtime redundancies by looking for collisions, but is there an easier solution? Consider the following slightly simplified example: class A { public int foo; } class B extends A { public int foo; public int bar; } class C { public int foo; } class Main { public static void main(String[] args) { A a = new A(); B b = new B(); C c = new C(); } } The method foo of class A is accessed by the methods foo of class C and by the method foo of class B. So if a foo field is assigned to a new A, and then to a new B, and then to a new C, you have a runtime redundancy. We know that during the initialization of the C instance, the a and b objects are put on the stack. So we can check the stack for something like this a or b.foo = c.foo. But how about this? A a = new A(); B b = new B(); C c = new C(); a.bar = c.foo;
